

BL5699 Capstone Project in Biotechnology (8MCs)

This is an independent, project-based module that can be completed in most cases without experimental laboratory work.

Students will complete a Master's-level project related to biotechnology. Rather than a one-size-fits-all project module, students will initiate, carry out, write up, and present their project in one of several possible frameworks, with learning outcomes and assessment criteria appropriate for a master's level programme. Faculty will serve as student mentors. Frameworks for projects include the following:

- Systematic review and meta-analysis.
- Emerging technology review
- Business development or new technology proposal
- Computational analysis project
- Computational methods project
