Upstream and Downstream Animal Welfare Consideration of Fish in Aquaculture Fish Farming

By Jackson Gross

UC Davis Department of Animal Science, USA

There are a number of animal welfare considerations that must be addressed to achieve good animal health in fish farming. While water quality and proper nutrition are a priority in for high survival and growth rates in fish farming, there are many other facets of fish welfare a producer must consider. Critical animal welfare issues exist during all stages of fish farming, throughout preharvest, harvest and post-harvest. This talk will highlight various aspects of fish welfare in aquaculture and discuss challenges of applying a one-size fits all approach to good aquaculture practices. We will cover a diversity of farmed fish with a focus on large finfish challenges.
